INTRODUCTION

INTRODUCTION

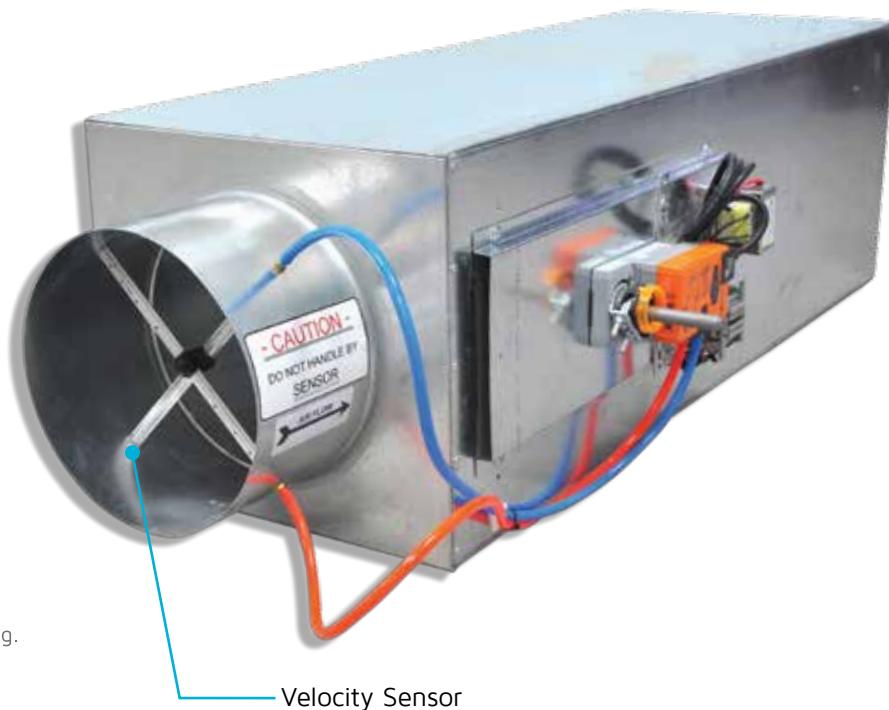

Khalid Manufacturing Company with its experience in the manufacture of air distribution products in Qatar for more than three decades has grown over the years by constantly upgrading its manufacturing process and has earned the reputation as a local manufacturing facility offering products complying with international standards.

Khalid Manufacturing Co. (KMC), having its manufacturing facility in Doha, Qatar, is pleased to announce its participation in the Air-Conditioning, Heating, and Refrigeration Institute's (AHRI) VAV certification program.

Pressure Independent VAVs manufactured by KMC in Qatar are now AHRI Certified.

Certificates downloaded from the directory may be used for rebates and other verification purposes.

AHRI Certified®

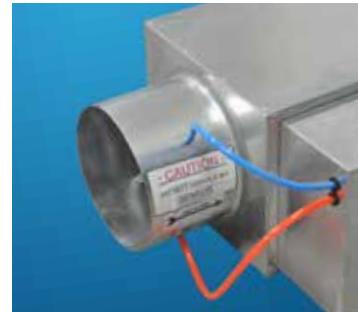

- Conforms to standard.
- Subject to rigorous and continuous testing.
- Manufacturers' performance ratings independently measured.
- Third-party verified.
- All products within program scope certified.
- Provides marketplace clarity.

Velocity Sensor

VAV Terminals
AHRI Standard 880

Look for the AHRI certified® mark to identify certified products, and see product listing in the AHRI Directory of certified product performance (www.ahridirectory.org).

Notes

- All sound data are measured in accordance with industry standard AHRI-880
- Sound power levels are in decibels, re 10-12 watts
- Discharge Lw includes end reflection loss per AHRI requirement

Features

Flexibility

- KSQ terminals are available in a wide array of control packages using electronic analog or factory-installed direct digital (DDC) controls.
- KSQ units can be provided with an integral sound attenuator for ultra-quiet performance
- Model KSQ is available using 25mm thick matte-faced insulation as a standard.
- Optionally 25mm thick Closed cell (fiber-less) insulation and a double wall construction using a full metal liner is also available.
- Numerous other optional features are available

Performance

- KMC model KSQ terminal ratings are AHRI Certified and all units are tested in accordance with AHRI Standard 880.
- The lack of intruding fasteners, tabs or other obstructions in the air stream results in very quiet sound performance and low internal pressure losses. All units incorporate full 90° rotation round dampers (except the size 24 x16) for precise control of the airflow.
- All units are available with pressure independent controls for precise control of the airflow. All units with these controls are factory calibrated for minimum and maximum airflow settings prior to shipment and are easily field adjusted.

Air Velocity Sensor

The air velocity sensor is used to measure air velocity / air volume in HVAC systems. The KMC Air velocity sensor operates and measures the total and static pressure components of airflow.

Amplification

The unique shape of the measuring profile creates a linear amplification (of at least 2.5x Pdyn) making accurate measurements from as low as 1,0 m/s air velocity possible. This means higher control pressure signals sent to the controller at much lower flow rates. This results in very stable flow control, even with high turn-down ratios

Low Pressure Drop & Sound

The sleek, aerodynamic unique shape creates a linear amplified signal and very little pressure drop for quiet operation and accurate control.

Ease of Installation and Reliability

KSQ terminals are compact and utilize inlet collars over 125mm in length to allow easy attachment of rigid or flexible duct. The airflow sensor is recessed over 50mm into the air valve providing protection from damage. The discharge end of the terminal has slip and drive connections for easy attachment of downstream duct work.

KMC's KSQ Single Duct terminals are constructed with zinc-coated steel for long life. The unit casings are assembled with a mechanical lock construction that ensures a tight seam to minimize air leakage.

Casings are internally lined with a wide variety of insulation and treatment options that conform to NFPA and UL requirements. The leaving edge of the insulation is protected from erosion by return bends on the discharge end of the unit casing.

The damper blade is made of gasket material sandwiched between two round steel plates. The round damper blade in the air valve is affixed to the shaft using through-the-shaft machine applied rivets. The die-cast metal shaft rotates in self-lubricating bearings for easy turning and long operating life. The damper's flexible gasket seats tightly on the cylinder's internal bead for tight closure. A damper position indicator is located on the end of the damper shaft.

Construction

- The Air velocity sensor is manufactured from Extruded aluminium profiles for durability.
- Multi point averaging
- 2% accuracy starting from 1,0 m/s air velocity
- Strengthens measurement signal with at least 2.5x.
- Rounded apertures make the velocity sensor insensitive to skew or turbulent inflow to 30° in all directions relative to the profile axis.
- The units can be supplied with factory-setting with the calibrated analog or digital controllers

Product Selection Check List

- Select Unit size based on desired performance characteristics.
- Select inlet size based on design Airflow requirements.
- Select actuator control orientation.
- Select Insulation Requirement.
- Select Control Requirement.

KMC's complete line of casing treatments and insulation systems provide performance solutions to meet any design requirement. We only use insulating materials that meet industry standard classifications for fire, erosion, water vapour absorption, and microbiological resistance.

25mm Matte Face- Black Cloth Faced Insulation.

Features:

- Faced with black strong durable, woven glass fabric
- Air Erosion rating > 46m/s as per UL181
- Thermal conductivity 0.031 W/m K @ 25°C
- Fire Classification as per ASTM E84
- Density 48kg/m³

Fiber-Less Insulation

Features:

- Closed Cell Insulation – no glass fibres
- 19mm /25mm – Elastomeric Engineered Foam Insulation
- Thermal conductivity 0.037 W/m K @ 25°C
- Fire Classification as per BS476

Dual-Wall Casing Treatment

Features:

- Puncture Proof sheet metal interior skin
- GI Perforated interior skin also available (Model KSQA only)
- 25mm – fiberglass insulation between walls
- Isolates glass fibres from the air stream
- Thermal conductivity 0.031 W/m K @ 25°C
- Fire Classification as per ASTM E84

CODES & STANDARDS

ASTM C1071 Standard Specification for Fibrous Glass Duct Lining Insulation

(This is a performance based standard that addresses acoustics as well as most of the performance criteria shown below)

Microbiological Resistance

UL 181 Factory-Made Air Ducts and Air Connectors (Mold Growth and Humidity)

ASTM C1071 Standard Specification for Fibrous Glass Duct Lining Insulation (Fungi Resistance Test)

ASTM G21 Practice for Determining Resistance of Synthetic Polymer Materials to Fungi

ASTM G22 Practice for Determining Resistance of Plastics to Bacteria

Fire Hazard Classifications:

ASTM E84 Test Method for Surface Burning Characteristics of Building Materials

UL 723 Test for Surface Burning Characteristics of Building Materials

BS476Part 7 Test for Surface spread of Flame

BS476Part 6 Test for Fire Propagation

NFPA 90A Standard for the Installation of Air Conditioning and Ventilating Systems

NFPA 90B Standard for the Installation of Warm Air Heating and Air Conditioning Systems

NFPA 255 Standard Method of Test of Surface Burning Characteristics of Building Materials

Air Erosion

UL 181 Factory-Made Air Ducts and Air Connectors

Water Vapour Sorption

ASTM C1104 Standard Test Method for Determining the Water Vapour Sorption of Unfaced Mineral Fibre Insulation

*In the interest of product development, KMC reserves the right to make changes without notice.

Selection

When selecting KSQ single duct variable air volume terminals, several factors must be considered to make the proper selection including:

- Air Flow and Air Pressure Drop
- Sound
- Heating (if required)
- Controls

Air Flow and Air Pressure Drop

All KSQ units can operate over a wide range of airflow. The minimum airflow shown for each unit is the lowest airflow at which the airflow sensor can generate an adequately strong signal for the pressure independent controls to operate properly. The maximum airflow shown for each unit is based on the industry practice of limiting the inlet air velocity to reasonable levels.

The units selected should be sized where the design airflow is between the maximum and minimum airflows shown in table 4. Referring to table 4 if 658 l/s (1400 cfm) is the maximum design airflow, a unit with a 300mm inlet (Model KSQ-12) can be selected with an air pressure drop of 2.5 Pa (0.01 inches w.g.)

Sound Performance

Tables 5 through 11 indicate the sound power levels of each unit at varying air flow rates and inlet static pressures. Disregarding other factors and/or equipment that could contribute to the noise in the occupied space, these ratings along with the acoustical environment in which the unit operates, will determine the perceived noise level.

Noise generated within the terminal and emitted through the discharge air (discharge sound) will be attenuated by any ductwork downstream of the terminal. The noise emitted through the casing of the terminal (radiated sound) will be attenuated by the room's ceiling. Depending upon the application, either the radiated or discharge noise level will be the relative higher and determine the perceived noise level in the occupied space. The occupied space itself will provide further attenuation depending on the acoustical characteristics of the walls, floors and internal furnishings.

All manufacturers must make certain assumptions on the acoustical environment of the application and then apply these assumptions to the unit's sound power ratings to determine the resultant sound pressures and perceived noise level in the occupied space. While the AHRI sound power ratings have been certified and can be accurately compared from one manufacturer to another, the NC values predicted will be dependent upon the acoustical assumptions made.

When selecting terminals, check the attenuation assumptions before comparing catalogued NC values. KMC uses the AHRI Standard 885, Appendix E attenuation assumptions for determining the anticipated noise levels. The attenuation assumptions in this standard are outlined in Table 2.

Table 2: ARI-885 Attenuation Table

Octave Band

						Total dB Reduction

Sound Performance

The noise level desired in any given space is a function of the activity for which the space is intended. Typical NC design values for various applications are:

Table 3: Typical NC Design Values

Hotel Rooms	25 - 35
Offices and conference rooms	25 - 35
Open Offices	30 - 40
Classrooms	35 - 40 (Max)
Churches	25 - 35
Hospital Wards	30 - 40
Gymnasiums	40 - 45
Libraries	30 - 40

The NC curves are intended to reflect a human's perceived noise comfort. Plotting the anticipated sound pressure by octave band and determining the tangent NC curve reached throughout all octave bands (using the acoustical assumptions) will indicate the NC value anticipated.

NC Curves for Specifying the Design Level in terms of the Maximum Permissible Sound Pressure Level for Each Frequency Band

Notes:

Size KSQ12

Radiated sound in the 250Hz (third octave) is the Controlling Band

Electric Heat

The wattage of electric heat needed is determined by the formula given below, which results in the KW of heating required.

$$P = \frac{Q \times (T_2 - T_1) \times 1.21}{3600}$$

P : Power in kW

Q : Air volume in m³/hour

T2- Temperature of air leaving the heater in °C

T1- Temperature of air entering the heater in °C

Using our example of a 300mm size inlet unit, if the design heating airflow is 375 lps (800 cfm /1360 cmh)) for the heating coil selection, the heating capacity desired is 5.4 KW of electric heat.

Q : Air volume in m³/hour 1360 cmh

T2- Temperature of air leaving the heater in 30°C

T1- Temperature of air entering the heater in 18°C

The electric coil with 5.5 KW would be selected. Electric heat can be staged or modulated.

Note that the electric coil has an air proving switch, which requires a minimum of 17.5 Pa (0.07 inch w.g). total pressure entering the coil to prove airflow. Also note that it's prudent to check the air temperature leaving the heating coil at the design airflow.

Control Sequences

A wide array of control sequences are available as standard on KMC – Model KSQ single duct variable air volume terminal

Airflow Ranges

Table 1: Airflow Ranges (Air Velocity Sensor)

Type		Analog Electronic Controller				Direct Digital Controller			
Model	Inlet size	Air Flow (cfm)		Airflow (lps)		Air Flow (cfm)		Airflow (lps)	
	mm	Min	Max	Min	Max	Min	Max	Min	Max
KSQ-5	125	25	305	12	144	45	350	22	165
KSQ-6	150	45	470	22	221	75	575	36	271
KSQ-7	175	75	635	36	299	100	750	47	353
KSQ-8	200	100	835	47	393	135	1050	64	494
KSQ-9	225	125	1100	59	517	170	1350	80	635
KSQ-10	250	145	1355	69	637	210	1650	99	776
KSQ-12	300	190	1740	90	818	294	2200	139	1034
KSQ-14	350	275	2300	130	1081	398	3000	188	1410
KSQ-16	400	500	3390	235	1594	530	4100	250	1927
KSQ-24X16	600 x 400	750	6480	353	3046	1005	7700	473	3619

Notes:

1. Minimum and maximum values shown are lps (cfm)
2. Minimum and maximum airflow with pressure independent controls based on the following flow sensor signals:
3. DDC Controllers 6.25Pa – 375Pa(0.025" w.g. – 1.5" w.g.)
4. Settings below the minimum are not recommended for accurate control when using pressure independent controls.
5. Minimum airflow for pressure dependent applications is 0 cfm.
6. Pressure independent controls may be set for 0 CFM, at or above the minimum airflow shown in table 1, but not between.

Table 2: Airflow vs. Velocity Sensor Signal

Airflow Calculations

$$\text{Sensor } \Delta P = (\text{CFM}/K)^2$$

$$\text{CFM} = K \times \sqrt{(\Delta P)}$$

Example:

For a 300mm (Size 12) inlet unit with a sensor ΔP signal of 0.60 inches w.g (150Pa), the airflow is calculated to be 1400 cfm (658 lps)

$$\text{CFM} = K \times \sqrt{(\Delta P)} = 1802 \times \sqrt{(0.60)} = 1400 \text{ for a 300mm (size 12) inlet unit with 1400 CFM,}$$

The sensor ΔP signal is calculated to be 0.60 inches w.g.

$$\Delta P = (\text{CFM}/K)^2 = (1400/1802)^2 = 0.60" \text{ w.g.}$$

Table 3: Airflow vs. Velocity Sensor Signal

Notes:

1. Air Pressure drops shown for KSQE Units with integral electric heating coil are for the terminal and the electric coil
2. Air Pressure drop is the difference in static pressure from the terminal inlet and discharge with the damper in the fully open position

Pressure Independent VAV

Notes

1. NC values are calculated based on procedures outlined in AHRI standard 885, appendix E as shown in table 2
2. Where no NC value is shown (---), NC values are less than 20

Features at a Glance

MODEL

KSQ - Basic Assembly

INLET SIZE

- 125mm (5"Ø)
- 150mm (6"Ø)
- 175mm (7"Ø)
- 200mm (8"Ø)
- 225mm (9"Ø)
- 250mm (10"Ø)
- 300mm(12"Ø)
- 350mm(14"Ø)
- 400mm (16"Ø)
- 600mm x 400mm (24"x16")

CASING CONSTRUCTION

- Galvanized Steel
- 304 Stainless Steel
- 316 Stainless Steel
- Aluminium

CASING THICKNESS

- 22 Gauge (0.8mm) Standard
- 20 Gauge (1.0mm)

CASING TREATMENTS

- 25mm Matte Faced Insulation
- 25mm Fiber-Less Insulation
- Dual Wall

CONTROL SYSTEM

- Electric Control
Control strategies available for all applications

ELECTRIC CONTROLS

- 24 VAC Actuator

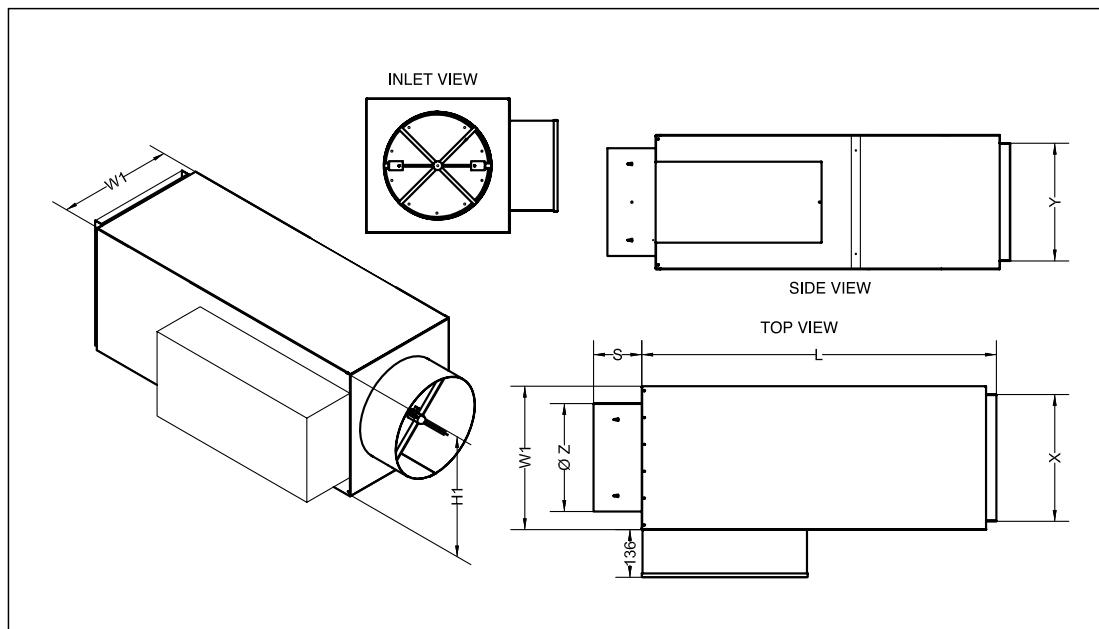

CONTROL SIDE

- Right Side
- Left Side

Pressure Independent VAV with Integral Sound Attenuator

Notes

1. NC values are calculated based on procedures outlined in AHRI standard 885, appendix E as shown in table 2
2. Where no NC value is shown (---), NC values are less than 20

Notes

1. NC values are calculated based on procedures outlined in AHRI standard 885, appendix E as shown in table 2
2. Where no NC value is shown (---), NC values are less than 20

Features at a Glance

Furnish and install KMC's KSQ Single Duct Variable Air Volume Terminals, KSQA Single Duct Variable Air Volume Terminals with integral sound attenuator, or KSQE Single Duct Variable Air Volume Terminals with integral electric heating coil as shown on the plans. The performance of all Single Duct Terminals shall be Rated in accordance to ARI standard 880. Discharge and radiated sound power levels shall not exceed the values as shown on the terminal unit schedule.

Casing Construction:

The unit casing shall be fabricated from zinc coated steel and use mechanical locking seams to form a leak resistant assembly. Any sealant used in the unit's construction must be approved for duct use and conform to NFPA 90A. Leakage through the Air Terminal casing shall be less than 1% of the maximum rated air flow @ 750 Pa (3" w.g) static pressure. The terminal discharge connection shall be Slip & Drive type integral to the casing.

The casing shall be:

- 0.8mm (22Ga) (standard), and 1.0 mm (20Ga)

The casing shall be provided with:

- Standard control enclosure
- Custom sized control enclosure
- Hinged front cover for control enclosure

Insulation and Treatment:

The unit casing shall be internally lined with:

- 25mm (1") thick aluminum foil-faced glass fiber insulation. The edges of the insulation shall be sealed with aluminum tape. The insulation shall conform to NFPA 90A, UL 181, and ASTM C665.
- 25mm (1") thick Matte faced insulation. The edges of the insulation shall be sealed with aluminum tape. The insulation shall conform to NFPA 90A, UL 181, and ASTM C665
- 25mm (1") thick (fiber-less) smooth skin surface closed cell foam insulation. The insulation shall conform to NFPA 255 and UL 181.
- No Insulation

Air Valve:

The damper assembly shall consist of a round blade that requires nominal 90-degree rotation from fully opened to fully closed positions on sizes 125 (5") through 16. The damper blade shall be mechanically attached to the die-cast metal damper shaft with through the shaft machine-applied rivets. The low leakage damper shall be constructed of a gasket material sandwiched between two 22-gauge zinc coated steel plates. Leakage through the damper shall be less than 1% of the maximum rated airflow at 750 Pa (3" w.g) static pressure. The damper gasket material is securely fastened between the two damper plates using machine applied rivets. The damper assembly shall rotate freely in Metal bearings. Damper position shall be indicated on the end of the shaft on the outside of the casing. Inlet connection and damper on size 600 x 400 (24 x 16) shall be rectangular.

Airflow Sensor:

A multi-point airflow sensor of the multi-point averaging type shall be located in the terminal inlet. The airflow sensor shall be designed to have unique shape and creates a linear amplified signal with a low noise level and pressure drop. The sensor shall amplify (at least 2.5x Pdyn) the velocity pressure signal and provide feedback of actual flow to the controller to have stable measuring signal from 0.8 m/s Air velocity

Electronic analog controls:

The electronic analog controls shall be suitable for a 24-volt control system. The electronic actuator shall be mounted at factory (either KMC's standard actuators or furnished by Customer) to move the damper from fully open to fully closed positions. The actuator shall be directly coupled to the damper shaft with no linkages.

- The electronic pressure independent controller shall control flow within +/-5% of the design airflow regardless of changes in system static pressure. The controller shall reset the flow as required by the thermostat. The maximum and minimum airflow set points shall be set at the factory. The electronic actuator and controller shall be combined in a single compact housing.

The terminal shall also be provided with:

- Transformer to step down incoming line voltage to 24 volts (standard on KSQE units with electric heating coils)
- Service disconnect switch for 24 volt controls (pilot duty)
- Line voltage fusing and fuse block

The wall thermostat shall be furnished by KMC for installation by the temperature control contractor. Flow adjustments shall be made at the wall thermostat utilizing a digital voltmeter.

It shall be the responsibility of the temperature control contractor to coordinate these requirements with manufacturer (KMC).

DDC Controls:

Terminal manufacturer (KMC) shall mount DDC controls provided by others. All mounting hardware should be provided by the DDC control supplier. It shall be the responsibility of the DDC supplier to coordinate and provide job specific wiring diagrams to the terminal manufacturer (KMC).

Electric Heating Coils:

KMC's KSQE units shall have the electric resistance type heating coils and coil controls. The electric coils shall be located a sufficient distance downstream of the primary air damper to prevent hot spots and nuisance tripping. The heating elements shall be installed as an integral part of the terminal unit. All terminals with electric heat shall include high grade nickel-chrome elements, a transformer, air proving switch, primary disc type automatic reset hi-limit (standard), secondary hi-limit manual reset cutout(optional), magnetic contractors and/or PE switches per step, grounding terminal, and circuit fusing on heaters exceeding 48 amps. Coil control enclosure panel and frame shall be constructed from galvanized steel. A wiring diagram shall be permanently affixed to the coil control enclosure panel. Refer to the terminal schedule on the plans for capacity and performance requirements.

- In Electronic analog control systems, the terminal manufacturer (KMC) shall interconnect the electronic controls with the electric coil for proper staging of heat. Power connection for the coil and associated flow controls shall be made at a single point. The coils shall also be provided with:
 - Door interlocking disconnect switch – non-fused (Optional)
 - Power-fusing (Fuses and fuse blocks)
 - SSR proportional modulating controller
 - Transformer
